

William Marlette

QA Automation Engineer

Brandon, FL | (813) 563-7752 | [linkedin.com/in/willmarl](https://www.linkedin.com/in/willmarl) | github.com/willmarl | willcat.dev

SUMMARY

QA automation engineer who came up through full-stack development. Wrote 231 tests across unit, integration, API, and E2E suites for a production NestJS codebase before ever applying to a QA role. Built DECT, an 8-step AI pipeline that generates structured test cases from requirement PDFs using equivalence partitioning and boundary value analysis. Familiar with SDLC/STLC, Jira, and formal test case design.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL

Testing & QA: Playwright, Vitest, LangChain, LangGraph, Jira

Backend: NestJS, FastAPI, PostgreSQL, Redis, BullMQ, Node.js, Prisma ORM

DevOps & Tools: Docker, Linux, Git, Nginx, AWS S3

EXPERIENCE

Full Stack Developer & IT Consultant

NestJS, Next.js, TypeScript, PostgreSQL – Aug 2025 – Present

Bonanza Breeze Inc

- Built and deployed a full-stack website and CRM for a small HVAC startup, currently live in production
- Implemented appointment booking with real-time availability calendar and transaction-level conflict prevention
- Designed Discord webhook pipeline via BullMQ for instant lead notifications on every new appointment and quote

PROJECTS

DECT

Python, LangChain, LangGraph, FastAPI – Sep 2025 – Oct 2025

AI pipeline that generates structured QA test cases from functional requirement PDFs

- 8-step LLM pipeline converts requirement PDFs into import-ready test cases: equivalence partitioning, boundary value analysis, and deduplication handled automatically
- LLM provider is swappable via config: OpenAI, Ollama, or Anthropic without touching pipeline code
- Each step saves output to disk, so failed runs can resume from where they left off without reprocessing

[GitHub](#)

Monno

NestJS, Next.js, TypeScript, PostgreSQL – 2024 – Present

Full-stack NestJS + Next.js monorepo boilerplate, reusable base for production apps

- 231 tests across unit, integration, API, and E2E suites; integration tests hit a real database, not mocks
- AI scaffolding CLI generates structured prompts for adding new CRUD resources, cutting down on AI hallucination when extending the codebase

Invare

NestJS, Next.js, TypeScript, PostgreSQL – Apr 2026 – Present

Hardware inventory tracker for electronics hobbyists: manage components, code snippets, and wiki

- External unit sync pipeline pulls curated hardware components from a public GitHub repo on startup, with admin-triggered re-sync and retired-unit preservation to avoid broken inventory references
- Fork/clone system: each unit tracks where it was cloned from, down to the original official slug and parent fork
- Wiki system serves both markdown documentation and official unit reference pages through shared slug routing
